Abstract—This manual provides solutions to the Assignment of Random Numbers

Guasssian to Other

5

1 Uniform Random Numbers

Let U be a uniform random variable between 0 and 1.

1.1 Generate 10^6 samples of U using a C program and save into a file called uni.dat .

Solution: Download the following files and execute the C program.

we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/1-1.c we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/cfunc.h

and compile and execute above files using following commands

1.2 Load the uni.dat file into python and plot the empirical CDF of *U* using the samples in uni.dat. The CDF is defined as

$$F_U(x) = \Pr\left(U \le x\right) \tag{1}$$

Solution: The following code plots Fig. 1.2

we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/1-2.py to get above fig compile above code using following commands

\$ python3 1-2.py

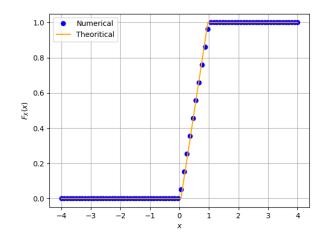

Fig. 1.2: The CDF of U

1.3 Find a theoretical expression for $F_U(x)$. Solution:

The CDF of U is given by

$$F_U(x) = \Pr\left(U \le x\right) = \int_{-\infty}^x p_U(u) du \quad (2)$$

We now have three cases:

- a) x < 0: $p_X(x) = 0$, and hence $F_U(x) = 0$.
- b) $0 \le x < 1$: Here,

$$F_U(x) = \int_0^x du = x \tag{3}$$

c) for x > 1 $F_U(x) = 1$ Therefore,

$$F_U(x) = \begin{cases} 0 & x < 0 \\ x & 0 \le x < 1 \\ 1 & x \ge 1 \end{cases}$$
 (4)

1.4 The mean of U is defined as

$$E[U] = \frac{1}{N} \sum_{i=1}^{N} U_i$$
 (5)

and its variance as

$$var[U] = E[U - E[U]]^2$$
 (6)

Write a C program to find the mean and variance of U.

Solution: Download the following files

we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/1-4.c we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/cfunc.h

execute them using following files

The value of mean is 0.500007 the value of variance is 0.083301

1.5 Verify your result theoretically given that

$$E\left[U^{k}\right] = \int_{-\infty}^{\infty} x^{k} dF_{U}(x) \tag{7}$$

Solution: we know that

$$var[U] = E[U - E[U]]^2$$
 (8)

$$= E[U^{2}] - (E[U])^{2}$$
 (9)

$$E\left[U^2\right] = \int_{-\infty}^{\infty} x^2 dF_U(x) \tag{10}$$

$$= \int_{-\infty}^{\infty} x^2 p_U(x) dx \tag{11}$$

$$= \int_0^1 x^2 dx = \frac{1}{3} \tag{12}$$

and

$$E[U] = \int_{-\infty}^{\infty} x dF_U(x)$$
 (13)

$$= \int_{-\infty}^{\infty} x p_U(x) dx \tag{14}$$

$$= \int_0^1 x dx = \frac{1}{2}$$
 (15)

we know mean = E[U] = 0.5

$$\operatorname{var}[U] = E[U - E[U]]^{2}$$

$$= E[U^{2}] - (E[U])^{2} = \frac{1}{3} - \frac{1}{4} = \frac{1}{12}$$
(17)
(18)

2 Central Limit Theorem

2.1 Generate 10⁶ samples of the random variable

$$X = \sum_{i=1}^{12} U_i - 6 \tag{19}$$

using a C program, where U_i , i = 1, 2, ..., 12 are a set of independent uniform random variables between 0 and 1 and save in a file called gau.dat

Solution: download following files

we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/2-1.c we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/cfunc.h

and execute them using below commands

2.2 Load gau.dat in python and plot the empirical CDF of *X* using the samples in gau.dat. What properties does a CDF have?

Solution: The CDF of *X* is plotted in Fig. 2.2 by downloading below file

we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/2-2.py

and executed using below commands

\$ python3 2-2.py

the properties of CDF are 1)The CDF is non decreasing function 2)It is symmetric about one point

2.3 Load gau.dat in python and plot the empirical PDF of *X* using the samples in gau.dat. The PDF of *X* is defined as

$$p_X(x) = \frac{d}{dx} F_X(x) \tag{20}$$

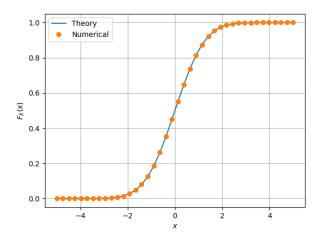

Fig. 2.2: The CDF of X

What properties does the PDF have? **Solution:** The PDF of *X* is plotted in Fig. 2.3 by downloading following codes

we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/2-3.py

and executed by using following commands

\$ python3 2–3.py

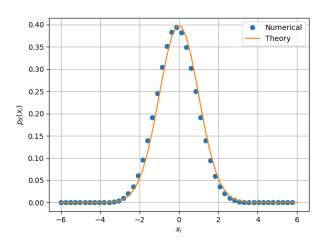

Fig. 2.3: The PDF of X

some properties are 1) area under curve is 1

2)it is symmetric about $x = \mu$

3)it is increasing for $x < \mu$ and decreasing for $x > \mu$

2.4 Find the mean and variance of *X* by writing a C program.

Solution: to find mean and variance download following files

we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/2-4.c we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/cfunc.h

and execute them using following commands

\$ gcc 2-4.c \$./a.out

the value of mean is 0.000326 the value of variance is 1.000906

2.5 Given that

$$p_X(x) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right), -\infty < x < \infty, \quad (21)$$

repeat the above exercise theoretically.

Solution:

1)CDF is calculated as follows:

$$\int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx \tag{22}$$

$$=\frac{1}{\sqrt{2\pi}}\times\sqrt{2\pi}\tag{23}$$

$$= 1 \tag{24}$$

MEAN can be calculated as follows:

$$\int_{-\infty}^{\infty} x \times \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx \tag{25}$$

$$=0 + (26)$$

2)mean is

$$E(x) = \int_{-\infty}^{\infty} x p_x(x) . dx$$
 (27)

$$= \int_{-\infty}^{\infty} x \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) . dx \qquad (28)$$

$$=0 (29)$$

(30)

$$E(x)=0$$

3)VARIANCE can be calculated as follows: $var[x] = E[X^2] - E[X]^2$ $var[X] = E[X^2]$ The variance is given by

$$E\left[X^{2}\right] = \int_{-\infty}^{\infty} x^{2} \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^{2}}{2}\right) = 0 \tag{31}$$

$$= \int_{-\infty}^{\infty} x \times x \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx \tag{32}$$

$$= x \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) \Big|_{-\infty}^{\infty}$$
 (33)

$$+ \int_{-\infty}^{\infty} 1 \times \int \frac{x}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right)$$
 (34)

$$= x \times 0 + \int_{-\infty}^{\infty} 1 \times \int \frac{x}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right)$$
 (35)

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \exp\left(-\frac{x^2}{2}\right)$$
 (36)

$$=1 \tag{37}$$

(38)

$$\therefore var[X] = 1$$

3 From Uniform to Other

3.1 Generate samples of

$$V = -2\ln(1 - U) \tag{39}$$

and plot its CDF.

Solution: download the following files

we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/3-1.c we get https://github.com/pettugadipranav/ Randomvar/blob/main/codes/cfunc.h

and execute them using following commands

The CDF of V is plotted in Fig. 3.1 using following codes

https://github.com/pettugadipranav/Randomvar/blob/main/codes/3-1.py

and execute them by following commands

3.2 Find a theoretical expression for $F_V(x)$.

Solution: for
$$Y = G(X)$$
 then $F_Y(y) = G(X)$

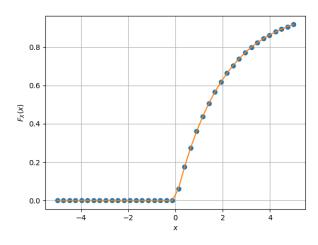

Fig. 3.1: The CDF of V

$$F_X(G^{-1}(y))$$
$$V = G(U)$$

$$U = G^{-1}(V) \tag{40}$$

$$=1-e^{-\frac{V}{2}} \tag{41}$$

then

$$F_V(v) = F_U(G^{-1}(v))$$
 (42)

$$=F_U(1-e^{-\frac{V}{2}})\tag{43}$$

$$\implies F_V(v) = \begin{cases} 0 & x < 0 \\ 1 - e^{-\frac{V}{2}} & x \ge 0 \end{cases} \tag{44}$$

Solution: Note that the function

$$v = f(u) = -2\ln(1 - u) \tag{45}$$

is monotonically increasing in [0, 1] and $v \in \mathbb{R}^+$. Hence, it is invertible and the inverse function is given by

$$u = f^{-1}(v) = 1 - \exp\left(-\frac{v}{2}\right)$$
 (46)

Therefore, from the monotonicity of v, and using (4),

$$F_V(v) = F_U \left(1 - \exp\left(-\frac{v}{2}\right) \right) \tag{47}$$

$$\implies F_V(v) = \begin{cases} 0 & v < 0 \\ 1 - \exp\left(-\frac{v}{2}\right) & v \ge 0 \end{cases} \tag{48}$$

4 Triangular Distribution

4.1 Generate

$$T = U_1 + U_2 (49)$$

Solution: Download the following files and execute the C program.

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/4-1.c \$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/cfunc.h

Execute the above C program files using the following commands

4.2 Find the CDF of T.

Solution: The CDF of T is plotted in Fig. 4.2 using the code below

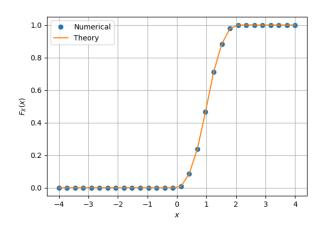

Fig. 4.2: The CDF of T

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/4-2.py

Download the above files and execute the following commands to produce Fig.4.2

4.3 Find the PDF of T.

Solution: The PDF of T is plotted in Fig. 4.2 using the code below

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/4-3.py

Download the above files and execute the following commands to produce Fig.4.2

\$ python3 4–3.py

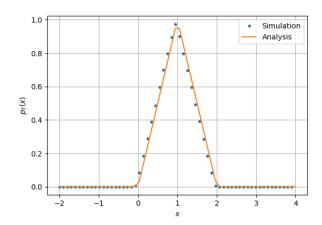

Fig. 4.3: The PDF of T

4.4 Find the Theoreotical Expression for the PDF and CDF of *T*

Solution:

$$T = U_1 + U_2 (50)$$

$$\implies p_T(t) = \int_{-\infty}^t p_{U1}(x) p_{U2}(y) dx \qquad (51)$$

As,
$$p_{U1}(x) = p_{U1}(y) = p_U(u)$$
 (52)

$$\implies p_T(t) = \int_{-\infty}^t p_U(u) p_U(t-u) du \qquad (53)$$

a) Theoretical PDF

i) For $0 < t \le 1$

$$p_T(t) = \int_0^t p_U(t-u)du$$
 (54)

$$\implies p_T(t) = \int_0^t du = t \tag{55}$$

ii) For $1 < t \le 2$

$$p_T(t) = \int_0^1 p_U(t - u) du$$
 (56)

$$\implies p_T(t) = \int_{t-1}^1 du = 2 - t$$
 (57)

$$\therefore P_T(t) = \begin{cases} 0 & t < 0 \\ t & 0 \le t \le 1 \\ 2 - t & 1 < t \le 2 \\ 0 & t > 2 \end{cases}$$

b) Theoretical CDF

$$F_T(t) = \int_{-\infty}^t p_T(u) du$$
 (58)

$$\therefore F_T(t) = \begin{cases} 0 & t < 0 \\ \frac{t^2}{2} & 0 \le t \le 1 \\ 2t - 1 - \frac{t^2}{2} & 1 < t \le 2 \\ 1 & t > 2 \end{cases}$$

4.5 Verify your results through a plot

Solution: The above theoretical results are verified through the plots in Fig 4.2 and Fig 4.3

5 Guasssian to Other

- 5.1 Generate equiprobable $X \in \{1, -1\}$. Solution: Download the following files and execute the C program.
 - \$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/5-1.c \$ https://github.com/pettugadipranav/

Randomvar/blob/main/codes/cfunc.h

Download the above files and execute the following commands

\$ gcc 5-1.c

\$./a.out

5.2 Generate

$$Y = AX + N, (59)$$

Where A = 5 dB, and $N \sim \aleph(0, 1)$.

Solution::

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/5-2.c

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/cfunc.h

Download the above files and execute the following commands

\$ gcc 5-2.c

\$./a.out

5.3 Plot Y using a scatter plot.

Solution: The CDF of V is plotted in Fig. 5.3 using the code below

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/5-3.py

Download the above files and execute the following commands to produce Fig.5.3

\$ python3 5-3.py

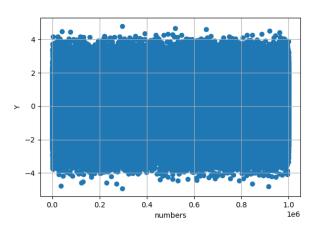

Fig. 5.3: The Scatter Plot

5.4 Guess how to estimate *X* from *Y*. **Solution:** :

- a) If Y < 0 then probably X = -1
- b) If Y > 0 then probably X = 1
- 5.5 Find

$$P_{e|0} = \Pr(\hat{X} = -1|X = 1)$$
 (60)

and

$$P_{e|1} = \Pr(\hat{X} = 1|X = -1)$$
 (61)

Solution::

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/5-5.c

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/cfunc.h

Download the above files and execute the following commands to get the result

\$ gcc 5-5.c

\$./a.out

$$P_{e|0} = 0.499033 \tag{62}$$

$$P_{e|1} = 0.500138 \tag{63}$$

5.6 Find P_e assuming that X has equiprobable symbols.

Solution:

$$P_e = P(X = 1)P_{e|0} + P(X = -1)P_{e|1}$$
 (64)

Since X is equiprobable

$$P(X = 1) = P(X = -1) = 0.5$$
 (65)

$$\implies P_e = \frac{P_{e|0} + P_{e|1}}{2} \tag{66}$$

$$\Longrightarrow \boxed{P_e = 0.499585} \tag{67}$$

5.7 Verify by plotting the theoretical P_e with respect to A from 0 to 10 dB.

Solution::

$$P_{e|0} = \Pr(\hat{X} = -1|X = 1)$$
 (68)

$$P_{e|0} = \Pr(AX + N < 0|X = 1)$$
 (69)

$$P_{e|0} = \Pr\left(N < -A\right) \tag{70}$$

$$P_{e|0} = \int_{-\infty}^{-A} \frac{e^{\frac{-x^2}{2}}}{\sqrt{2\pi}} \tag{71}$$

$$P_{e|0} = \int_{A}^{\infty} \frac{e^{\frac{-x^2}{2}}}{\sqrt{2\pi}}$$
 (72)

$$P_{e|0} = Q_N(A) \tag{73}$$

Similarly,
$$P_{e|1} = Q_N(A)$$
 (74)

\$ https://github.com/pettugadipranav/ Randomvar/blob/main/codes/5-7.py

Download the above files and execute the following commands to produce Fig.5.7

$$$$$
 python3 5–7.py

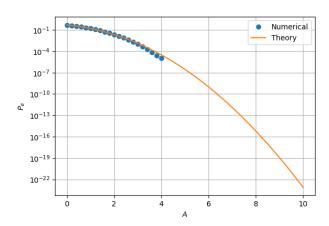

Fig. 5.7: $P_e(A)$ with semilog-y axis

5.8 Now, consider a threshold δ while estimating X from Y. Find the value of δ that maximizes the theoretical P_e .

Solution: To estimate X from Y, we now consider the following:

$$X = \begin{cases} 1, & Y > \delta \\ -1, & Y < \delta \end{cases} \tag{75}$$

Therefore,

$$P_{e|0} = \Pr(\hat{X} = -1|X = 1)$$
 (76)

$$= \Pr(AX + N < \delta | X = 1) \tag{77}$$

$$\implies P_{e|0} = \Pr(N < \delta - A) \tag{78}$$

$$= \int_{-\infty}^{\delta - A} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx \tag{79}$$

$$= \int_{A-\delta}^{\infty} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx \tag{80}$$

$$\implies P_{e|0} = Q_N(A - \delta) \tag{81}$$

Similarly,

$$P_{e|1} = Q_N(A + \delta) \tag{82}$$

$$P_e = P_{e|0} \Pr(X = 1) + P_{e|1} \Pr(X = -1)$$
(83)

$$=\frac{Q_N(A-\delta)+Q_N(A+\delta)}{2}$$
 (84)

Differentiating the above equation wrt δ :

$$0 = \frac{d}{d\delta} \left(\frac{Q_N(A - \delta) + Q_N(A + \delta)}{2} \right)$$
(85)

$$=\frac{1}{2}\left(\frac{1}{\sqrt{2\pi}}e^{-\frac{(\delta-A)^2}{2}}-\frac{1}{\sqrt{2\pi}}e^{-\frac{(A+\delta)^2}{2}}\right)$$
(86)

$$\implies (\delta - A)^2 = (\delta + A)^2 \tag{87}$$

$$\implies \boxed{\delta = 0} \tag{88}$$

5.9 Repeat the above exercise when

$$p_X(0) = p \tag{89}$$

Solution: Using Eq. (83), we have:

$$P_{e} = P_{e|0}p + P_{e|1}(1-p) \tag{90}$$

$$= pQ_N(A - \delta) + (1 - p)Q_N(A + \delta)$$
 (91)

Differentiating as before, we get:

$$0 = p \frac{1}{\sqrt{2\pi}} e^{-\frac{(\delta - A)^2}{2}} - (1 - p) \frac{1}{\sqrt{2\pi}} e^{-\frac{(A + \delta)^2}{2}}$$
 (92)

$$e^{\frac{(\delta+A)^2 - ((\delta-A))^2}{2}} = \frac{1-p}{p}$$

$$\Longrightarrow \boxed{\delta = 0}$$
(93)

$$\implies \boxed{\delta = 0} \tag{94}$$

5.10 Repeat the above exercise using the MAP criterion.

Solution: Assume that

$$\Pr\left(X = -1\right) = p \tag{95}$$

$$\Pr(X = 1) = (1 - p) \tag{96}$$

From Total Probability Theorem, we have:

$$p_Y(y) = p_{Y|X=-1}(y|-1) \Pr(X = -1) + p_{Y|X=1}(y|1) \Pr(X = 1)$$
(97)

$$p_Y(y) = p \times p_{(-A+N)}(y) \tag{98}$$

$$+(1-p) \times p_{(A+N)}(y)$$
 (99)

$$p_Y(y) = p \frac{e^{-\frac{(y+A)^2}{2}}}{\sqrt{2\pi}} + (1-p) \frac{e^{-\frac{(y-A)^2}{2}}}{\sqrt{2\pi}}$$
 (100)

To use the MAP criterion, we must find $p_{X|Y}(x|y)$. To do this, we use the Theorem of Conditional Probability:

$$p_{X|Y}(x|y) = \frac{p_{Y|X}(y|x) \times p_X(x)}{p_Y(y)}$$
 (101)

When X = 1, we have:

$$p_{X|Y}(1|y) = \frac{p_{Y|X}(y|1) \times p_X(1)}{p_Y(y)}$$
(102)

$$= \frac{(1-p)\frac{e^{-\frac{(y-A)^2}{2}}}{\sqrt{2\pi}}}{p\frac{e^{-\frac{(y+A)^2}{2}}}{\sqrt{2\pi}} + (1-p)\frac{e^{-\frac{(y-A)^2}{2}}}{\sqrt{2\pi}}}$$
(103)

$$= \frac{(1-p)e^{2yA}}{p+(1-p)e^{2yA}}$$
 (104)

Similarly, when X = -1, we get:

$$p_{X|Y}(-1|y) = \frac{p}{p + (1-p)e^{2yA}}$$
 (105)

Therefore, when $p_{X|Y}(1|y) > p_{X|Y}(-1|y)$, we

have:

$$\frac{(1-p)e^{2yA}}{p+(1-p)e^{2yA}} > \frac{p}{p+(1-p)e^{2yA}}$$
 (106)

$$e^{2yA} > \frac{p}{(1-p)} \tag{107}$$

$$\implies y > \frac{1}{2A} \ln \frac{p}{(1-p)} \tag{108}$$

Therefore, when Eq. (108), we can assert that X = 1, and X = -1 otherwise. Now, consider when $p = \frac{1}{2}$. We have:

$$y > \frac{1}{2A} \ln \frac{p}{(1-p)}$$
 (109)

$$= \frac{1}{2A} \ln 1$$
 (110)

$$=0 (111)$$

Therefore, when y > 0, we choose X = 1, and we choose X = -1 otherwise.
